Q's and A's:
1.All but the input and output operators are members.
2. Anyhting that doesnt change the original values should be const, or anything that is
3. Equality returns a bool, input and output return their respective streams, and assig
nment returns a new object.
4.No, it would be better off as a funtion to find midpoint because the / operator can
be used for its intened purpose.
5.Less than or greater than is hard to determine when it comes to points. If it were t
o be used, it would only be arithmetic and wouldnt serve a greater purpose in the prog
6.Operators are finite, its better to call flip and shift by functions rather than ope
7.No, the original methods are still useful when called directly.\033]0;g_butler4@mars
